# **Stochastic Processes: Data Analysis and Computer Simulation**

# Python programming for beginners

# 3. The Euler method for numerical integration

# 3.1. Ordinary differential equations (ODE)

#### 1st order ODE

• Consider the following 1st order differential equation.

$$\frac{dy(t)}{dt} = f(y(t), t) \tag{A1}$$

- Assume that the initial conditions are  $y = y_0$  at time  $t = t_0$ .
- We need to determine y(t), for any  $t \ge t_0$ .

#### **Formal solution**

• Integrate Eq.(A1) over time, from  $0 \to t$ , to obtain the formal solution for y(t)

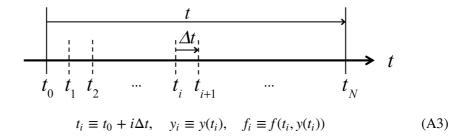

$$y(t) = y_0 + \int_{t_0}^{t} dt' f(y(t'), t')$$
 (A2)

## 3.2. Numerical calculation

1 / 4 2017/05/24 10:16

#### **Discretization**

ullet Divide the total time span  $t_0 
ightarrow t$  into N equally spaced segments, each describing a time increment  $\Delta t$ .

## Advancing the solution forward a small step $\Delta t$

• Integrate Eq.(A1) over a small time interval, from  $t_i \rightarrow t_{i+1} (= t_i + \Delta t)$ ,

$$y_{i+1} = y_i + \int_{t_i}^{t_{i+1}} dt' f(y(t'), t')$$
(A3)

$$= y_i + \int_0^{\Delta t} d\tau f(y(t_i + \tau), t_i + \tau) \qquad (\tau \equiv t' - t_i)$$
(A4)

$$= y_i + \int_0^{\Delta t} d\tau \left[ f_i + \mathcal{O}(\tau) + \mathcal{O}(\tau^2) + \cdots \right]$$
 (A5)

$$= y_i + \left[\tau f_i + \mathcal{O}(\tau^2) + \mathcal{O}(\tau^3) + \cdots\right]_0^{\Delta t}$$

$$= y_i + \Delta t f_i + \mathcal{O}(\Delta t^2) + \mathcal{O}(\Delta t^3) + \cdots$$
(A6)

$$= y_i + \Delta t f_i + \mathcal{O}(\Delta t^2) + \mathcal{O}(\Delta t^3) + \cdots$$
 (A7)

#### **Euler method**

• Difference equation  $\rightarrow$  1st order in  $\Delta t$ 

$$y_{i+1} = y_i + \int_{t_i}^{t_{i+1}} dt' f(y(t'), t') \simeq y_i + \Delta t f_i$$
 (A8)

Simulation procedure → Explicit method

$$y_0, f_0 \xrightarrow{\text{Eq.(A8)}} y_1, f_1 \xrightarrow{\text{Eq.(A8)}} \cdots y_i, f_i \cdots \xrightarrow{\text{Eq.(A8)}} y_N, f_N$$
 (A9)

• Forward difference approximation (1st order)

$$\frac{dy(t)}{dt}\bigg|_{t=t_i} \simeq \frac{y_{i+1} - y_i}{\Delta t}$$
 (A10)

## Leapfrog method

Central difference approximation

$$\left. \frac{dy(t)}{dt} \right|_{t=t_i} \simeq \frac{y_{i+1} - y_{i-1}}{2\Delta t} \tag{A11}$$

• Difference equation, Substitute Eq.(A11) in Eq.(A1)

$$y_{i+1} = y_{i-1} + \int_{t_{i-1}}^{t_{i+1}} dt' f(y(t'), t') \simeq y_{i-1} + 2\Delta t f_i$$
 (A12)

Simulation procedure → Explicit method

$$y_{-1}, f_0 \xrightarrow{\text{Eq.(A11)}} y_1, f_2 \xrightarrow{\text{Eq.(A11)}} \cdots y_i, f_{i+1} \cdots \xrightarrow{\text{Eq.(A11)}} y_N$$

$$y_0, f_1 \xrightarrow{2\Delta t} y_2, f_3 \cdots \xrightarrow{\text{Eq.(A11)}} y_{N-1}, f_N$$
(A13)

$$y_0, f_1 \xrightarrow{\text{Eq.(A11)}} y_2, f_3 \cdots \xrightarrow{\text{Eq.(A11)}} y_{N-1}, f_N$$
 (A14)

### Runge-Kutta (2nd)

Difference equation

$$y_{i+1} = y_i + \int_{t_i}^{t_{i+1}} dt' f(y(t'), t') \simeq y_i + \Delta t f'_{i+\frac{1}{2}}$$
 (Leapfrog) (A15)

$$y'_{i+\frac{1}{2}} = y_i + \frac{1}{2}\Delta t f_i, \qquad f'_{i+\frac{1}{2}} = f(y'_{i+\frac{1}{2}}, t_{i+\frac{1}{2}})$$
 (Euler) (A16)

Simulation procedure → Explicit method

$$y_{0}, f_{0} \xrightarrow{\frac{\text{Eq.(A16)}}{\frac{1}{2}\Delta t}} y'_{\frac{1}{2}}, f'_{\frac{1}{2}} \qquad y_{i}, f_{i} \xrightarrow{\frac{\text{Eq.(A16)}}{\frac{1}{2}\Delta t}} y'_{i+\frac{1}{2}}, f'_{i+\frac{1}{2}}$$

$$y_{1}, f_{1} \xrightarrow{\frac{\text{Eq.(A16)}}{\frac{1}{2}\Delta t}} y'_{1+\frac{1}{2}}, f'_{1+\frac{1}{2}} \xrightarrow{\cdots} \xrightarrow{\frac{\text{Eq.(A16)}}{\frac{1}{2}\Delta t}} y'_{N-\frac{1}{2}}, f'_{N-\frac{1}{2}}$$

$$y_{0}, f'_{\frac{1}{2}} \xrightarrow{\text{Eq.(A15)}} y_{1}, f'_{1+\frac{1}{2}} \xrightarrow{\text{Eq.(A15)}} \cdots y_{i}, f'_{i+\frac{1}{2}} \xrightarrow{\cdots} \xrightarrow{\text{Eq.(A15)}} y_{N}$$
(A17)

## Runge-Kutta (4th)

Difference equation

$$y_{i+1} = y_i + \int_{t_i}^{t_{i+1}} dt' f(y(t'), t')$$

$$\simeq y_i + \frac{1}{6} \Delta t \left[ f_i + 2f'_{i+\frac{1}{2}} + 2f''_{i+\frac{1}{2}} + f'''_{i+1} \right]$$
(A18)

$$y'_{i+\frac{1}{2}} = y_i + \frac{\Delta t}{2} f_i,$$
  $f'_{i+\frac{1}{2}} = f(y'_{i+\frac{1}{2}}, t_{i+\frac{1}{2}})$  (A19)

$$y''_{i+\frac{1}{2}} = y_i + \frac{\Delta t}{2} f'_i, \qquad f''_{i+\frac{1}{2}} = f(y''_{i+\frac{1}{2}}, t_{i+\frac{1}{2}})$$

$$y'''_{i+1} = y_i + \Delta t f''_{i+\frac{1}{2}}, \qquad f'''_{i+1} = f(y'''_{i+1}, t_{i+1})$$
(A20)

$$y_{i+1}''' = y_i + \Delta t f_{i+1}'', \qquad f_{i+1}''' = f(y_{i+1}'', t_{i+1})$$
(A21)

# 3.3. Try the Euler method using Python

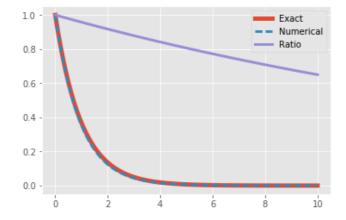

### A very simple problem

• Numerically solve the following differential equation and determine y(t) for  $0 \le t \le 10$  with the initial condition y = 1 at t = 0. Then compare it with the analytical solution  $y = \exp(-t)$ .

$$\frac{dy(t)}{dt} = -y(t) \tag{A22}$$

```
In [1]: % matplotlib inline
    import numpy as np  # import numpy library as np
    import matplotlib.pyplot as plt # import pyplot library as plt
    plt.style.use('ggplot')  # use "ggplot" style for graphs
```

```
In [2]: # Euler method
dt, tmin, tmax = 0.1, 0.0, 10.0 # set \Delta t,t0,tmax
step=int((tmax-tmin)/dt)
# create array t from tmin to tmax with equal interval dt
t = np.linspace(tmin,tmax,step)
y = np.zeros(step) # initialize array y as all 0
ya = np.exp(-t) # analytical solution y=exp(-t)
plt.plot(t,ya,label='Exact',lw=5) # plot y vs. t (analytical)
y[0]=1.0 # initial condition
for i in range(step-1):
    y[i+1]=y[i]-dt*y[i] # Euler method Eq.(A8)
plt.plot(t,y,ls='--',lw=3,label='Numerical') # plot y vs t (numerical)
plt.plot(t,y/ya,lw=3,label='Ratio') # plot y/ya vs. t
plt.legend() #display legends
plt.show() #display plots
```
